Patent Claims:

2

1

4 An attachment for or on an illuminating device of preferably 5 uneven surfaces, in particular tooth surfaces, and/or for a or on a detection unit, in particular an intraoral camera, 6 7 whereby the illuminating device and/or the detection unit have at least one light source, characterized in that the 8 attachment (1) comprises a solid, transparent, preferably 9 homogeneous, colourless and/or optically clear conductor (2) 10 11 having an, in particular, essentially flat, light-admission surface (6) and a light-exit surface (4), and a transparent, 12 13 preferably homogeneous, colourless and/or optically clear 14 pad (3) adjoining the conductor (2) or the light-exit surface (4) of the conductor (2) in a form-locking and optionally 15 material-locking manner. 16

17

18 2. The attachment according to claim 1, characterized in that 19 the conductor (2) consists of a rigid and hard first material. 20 e.g. of glass or plastic, prferably polymethyl methacrylate, 21 polycarbonate, polyamide, styrene acrylnitrile 22 polystyrene, sealing compounds or casting resins based on 23 epoxide resin, polyurethane resin, organo-polysiloxane or 24 the like, in particular having a ball-pressure hardness of 25 >100 measured according to ISO 2039-1.

26

The attachment according to claim 1 or 2, characterized in that the pad (3) is formed as a solid body and consists of a ductile, flexible and/or elastic second material, e.g. of silicone or a silicone derivative or polyurethane, in particular having a shore-A-hardness of <40.

32

33 4. The attachment according to any one of the claims 1 to 3, 34 characterized in that the first material has a higher 35 refractive index than the second material.

36

37 5. The attachment according to claim 1 or 2, characterized in

that the pad (3) is designed as a hollow body whose preferably very thin or foil-like casing consists of a ductile, flexible and/or elastic material, e.g. of a silicone or a silicone derivative or polyurethane, and is filled with a transparent, preferably colourless and/or optically clear medium, e.g. a liquid or a gel, in particular water, a sodium chloride solution, etc.

8

9 6. The attachment according to any one of the claims 1 to 5, 10 characterized in that the conductor (2) has the geometric 11 form of a body with an upper part (11) in the form of a cylinder or a parallelepiped, preferably a rectangular parallelepiped, 12 13 and optionally a lower part (12) molded on or adjoins the upper part (11) with its base centrosymetrically in one piece 14 in the area of the light exit, said lower part (12) being 15 16 in the form of a cone, a truncated cone or a cone with a rounded tip, a pyramid, etc. 17

18

19 7. The attachment according to any one of the claims 1 to 6, 20 characterized in that the conductor (2) is formed in two 21 pieces consisting of the upper part (11) and the lower part 22 (12), preferably with the same basal surface, whereby the 23 upper part (11) and the lower part (12) are connected in a material-locking manner, in particular by gluing with a 24 transparent, optically clear adhesive which preferably has 25 26 a refractive index that lies between the refractive indices 27 of the upper part (11) and the lower part (12).

28

The attachment according to any one of the claims 6 to 7, characterized in that the flanks or the sheathing of the lower part (12) or the light-exit surface (4) have an angle of slope (α) vis-à-vis the inclination of the light-admission surface (6) of maximum 60°, in particular of maximum 53°, preferably of maximum 45°.

35

The attachment according to any one of the claims 1 to 8,characterized in that the pad (3) has a recess complementary

to the lower part (12) for accommodating the conductor (2) or the lower part (12).

3

The attachment according to any one of the claims 6 to 9, characterized in that the tip (7) of the lower part (12) essentially ends in a plane with the surface of the pad (3) facing away from the light-exit surface (4) of the conductor (2).

9

10 11. The attachment according to any one of the claims 1 to 10, characterized in that a carrier part (13) for mounting or handling or fastening components is fastened or clamped to the attachment (1), in particular to the conductor (2), preferably in a notch or groove (20) of the conductor (2) extending in peripheral direction.

16

17 12. The attachment according to any one of the claims 1 to 11, characterized in that a diffusing lens (19) fastened, in particular, to the carrier part (13) or to the conductor (2) is provided at or in front of the light-admission surface (6) of the conductor (2), preferably between the light-admission surface (6) and the light source (21).

23

24 13. The attachment according to any one of the claims 1 to 12, 25 characterized in that the light source (21), e.g. light diodes, 26 is fastened at or in front of the light-admission surface 27 (6) of the conductor (2), in particular in the centre or in 28 a circular manner about the median axis (14) of the conductor 29 (2), in particular to the carrier part (13).

30

31 The attachment according to any one of the claims 1 to 13, 32 characterized in that the detection unit (15), in particular 33 an image-recording and/or generating and/or transmitting 34 device, in particular a video camera, e.g. an intraoral camera, 35 or a CCD chip, is fastened to or in front of 36 light-admission surface (6) of the conductor (2), 37 particular in the centre or centrosymmetrically to the median

axis (14), in particular to the carrier part (13).

2

4

5

6 7 15. The attachment according to any one of the claims 11 to 14, characterized in that a handle (16) can be inserted or mounted on or in the carrier part (13), whereby a recess (17) is preferably formed in the carrier part (13) through which the conductor (2) is connected in an optically conducting manner with the detection unit (15) and/or the light source (21).

8 9

10 16. The attachment according to any one of the claims 1 to 15, 11 characterized in that the light source (21) and the detection unit (15) are integrated in the handle (16), in particular 12 in the top of the handle (18) close to the carrier part (13), 13 14 or that the light source (21) and/or the detection unit (15) are arranged outside of the attachment (1) in an external 15 component and are connected with the conductor (2) in an 16 17 optically-conducting manner via at least one transmitting unit provided in the handle (16) or in the top 18 of the handle (18), e.g. a mirror or a glass fiber line. 19

20

The attachment according to any one of the claims 1 to 16, 21 17. 22 characterized in that the height (H) of the conductor (2), 23 measured from the light-admission surface (6) to the tip (7) of the lower part (12), corresponds to the focal length of 24 25 the detection unit (15), in particular of the intraoral camera, or that the height (H) of the attachment (1), measured from 26 27 the light-admission surface (6) to the surface of the pad (3) facing away from the conductor (2), corresponds to the 28 focal length of the detection unit (15), in particular the 29 30 intraoral camera.

31

32 18. An illuminating device or a device for detecting or recording 33 surface features, in particular colours, structures, etc., 34 or an intraoral camera, comprising an attachment according 35 to any one of the claims 1 to 17.
